Goals

- ▶ Define **Elementary Matrices**, corresponding to elementary operations.
- ▶ We will see that performing an elementary row operation on a matrix A is same as multiplying A on the left by an elementary matrix E .
- ▶ We will see that any matrix A is invertible **if and only if** it is the product of elementary matrices.

Definition

Definition: A square matrix A (of size $n \times n$) is called an **Elementary Matrix** if it can be obtained from the identity matrix I_n by a single elementary row operation. That means A is obtained by

- ▶ switching two rows on I_n , or
- ▶ multiplying a row of I_n by a scalar $c \neq 0$ or
- ▶ adding a scalar multiple of a row of I_n to another row.

Inverse of Elementary Matrices

Theorem If E is elementary, then E^{-1} exists and is elementary.

- ▶ **Proof** For each of the three types of elementary matrices, write down the inverse and check. I will do it on the board.

Row Equivalence

Theorem 2.2

Examples

Example 2.4.1

Let

$$A = \begin{bmatrix} 1 & 0 & 0 \\ 3 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Is this matrix elementary. If yes why?

Answer: Yes, it is. The matrix A is obtained from I_3 by adding 3 time the first row of I_3 to the second row.

Row Equivalence

Theorem 2.2

Examples

Example 2.4.2

Let

$$A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1.5 \end{bmatrix}$$

Is this matrix elementary. If yes why?

Answer: Yes, it is. The matrix A is obtained from I_3 by multiplying its third row by 1.5.

Example 2.4.3

Let

$$A = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{bmatrix}$$

Is this matrix elementary. If yes why?

Answer: Yes, it is. The matrix A is obtained from I_3 by switching its first and third row.
